

Hands-on UI/UX Experiments.

a). Explore the fundamentals of UI and UX.

(i) UI (user interface).

- * The visual and interactive elements of a product (colors, typography, buttons, icons, layouts)

- * Focus : look and feel of the design.

- * Goal : Make the interface attractive, consistent and easy to use.

(ii) UX (user Experience)

- * The overall journey of the user when interacting with the product (ease of navigation, satisfaction, usability).

- * Focus : functionality and experience.

- * Goal : Ensure the product solves the user problem effectively with minimal friction.

Eg:

- * A beautiful button design → UI

- * What happens when you click the button (smooth flow, success message, logical navigation) → UX

b) Differentiate between UI & UX using real world case studies.

Spotify	Amazon	Instagram
* UI - clean sleek theme, album art display, smooth animation, well placed control. * UX - Easy Playlist creation, Personalized recommendations, Seamless music streaming.	* UI - Product grid, search bar, filters, Product images, Buy button. * UX - one click checkouts, fast delivery updates, review system that builds trust.	* UI - Minimal icons, Photo/Video feed, bold color highlights for stories. * UX: Endless scrolling, Addictive content suggestions, easy content posting & sharing.

Observation: A Product can look good (UI) but still be frustrating (UX) if

Navigation is confusing.

* Conversely, a Product with plain visuals but seamless flow can succeed due to good UX.

c. Illustrate the relationship between UI & UX in design.

* UI & UX are complementary - one cannot succeed without the other

i) Relationship Model.

* UX is the foundation (research, flow, functionality)

* UI is surface layer (visual polish, aesthetics).

Analogy:

* UI is like packaging a smartphone (design, box, branding)

* UX is the experience of using the smartphone (speed, features, durability).

d. Demonstrate various UI/UX design tools in details

1. Figma (UI+UX)

- * cloud-based, real-time collaboration.
- * Great for wireframing, Prototyping, UI components.
- * Popular for team projects.

2. Adobe (UI+UX)

- * Drag and drop Prototyping.
- * Integration With Adobe suite.
- * Responsive design layouts.

3. Sketch (UI focus)

- * vector-based design tool (Mac-only)
- * strong plugin ecosystem.
- * Great for pixel Perfect UI designs.

4. Invision (UX+ prototyping)

- * Used for interactive prototypes
- * User testing features.
- * Feedback & collaboration.

5. Balsamiq (UX wireframing)

- * Focus on low fidelity sketches

- * Quick Experimentation with layouts.

6. Canva (UI support)

- * Not a dedicated UI/UX tool, but useful for creating assets like icons, banners.
